

AmparoLex

DEVELOPMENT · PRIVACY · INNOVATION

DIGITAL SOLUTIONS WITH LEGAL INSIGHT

We design, build and improve digital experiences. We integrate technology, automation, data protection and security considerations from the outset.

WEB DEVELOPMENT

AUTOMATION

DATA & PRIVACY

FROM IDEA TO VERIFIABLE SOLUTION

One brand, two complementary lines

AmparoLex combines the development of its own legal technology platform with services for other organizations.

AmparoLex Platform

An evolving legal technology platform: case management, lookups, document tools, verification and integrations.

It also serves as a practical environment for improving software, controls and user experience.

Professional Services

Digital solutions for organizations of different sizes, sectors and operating models.

Assessment, development, automation, privacy, technical improvements and ongoing support.

WHAT SETS OUR APPROACH APART

1

Understanding the problem

We first understand goals, workflows and risks before proposing technology.

2

Legal and technical insight

Software should be useful while respecting data protection and earning trust.

3

Verifiable work

Every improvement needs functional testing and a documented scope.

Our approach: a tailored solution. We can enhance an existing platform, modernize it or build a new product, based on the need and technical and financial feasibility.

A broad, modular portfolio

Clients choose only the components they need, without being tied to a specific technology or vendor.

01 / SERVICE

Web and application development

Corporate websites, portals, landing pages, private areas, forms and web tools tailored to each project.

Design • frontend • backend • testing

02 / SERVICE

Automation and artificial intelligence

Workflows, assistants, document classification, integrations and prototypes of AI-assisted processes.

Integrations • APIs • applied AI

03 / SERVICE

Privacy and digital compliance

Data mapping, policy reviews, third-party services, consent and applicable regulatory requirements.

Personal data • compliance • evidence

04 / SERVICE

Preventive digital security

Defensive review of visible configurations, external assets, sessions, permissions, rate limits and safeguards.

Assessment • hardening • follow-up

05 / SERVICE

Documents and digital identity

Document workflows, verification, signatures, traceability, access and information-management tools.

Documents • signatures • identity

06 / SERVICE

Maintenance and continuous improvement

Regular reviews, updates, bug fixes, monitoring and feature enhancements.

Support • evolution • quality

Modular engagement: from a focused assessment to end-to-end development or ongoing support.

From a need to a digital project

A clear, adaptable process with decisions made together with the client.

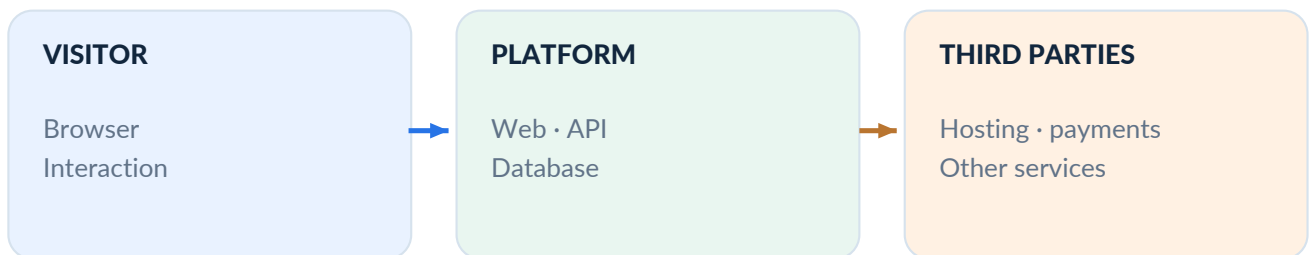

A project does not end when “the page loads.” It ends when the agreed changes work, responsibilities are clear and delivery is evidenced.

Privacy and security built in

Publishing legal text is not enough: we must observe what each system actually does.

EXAMPLE: WEBSITE DATA FLOW

Key questions: what data is collected, who receives it, why, for how long, what control does the user have, and what evidence supports our answers?

FOUR LAYERS OF VERIFICATION

Interface

Forms, navigation, cookies, fonts and libraries.

Application

APIs, authentication, authorization, registration and minimization.

Infrastructure

Hosting, dependencies, backups, access and vendors.

Documentation

Policies, terms, contracts and procedures.

Outcome: data map + prioritized findings + concrete actions + follow-up testing of corrections.

We work across sectors

Digital challenges cross sectors. Solutions are tailored to each activity and its obligations.

Businesses and startups

Online presence, automation, forms, sales, customer service and privacy.

Law firms and professionals

Portals, document management, bookings, communication, client data and confidentiality.

Public bodies and services

Citizen services, transparency, accessibility, traceability and public information.

Education and nonprofits

Registration, content, events, communities, participant data and coordination.

Technology and SaaS platforms

Registration, identity, roles, integrations, APIs and security documentation.

Retail and services

Payments, catalogs, support, automation, communications and vendors.

The method is consistent; the diagnosis is not. A business, law firm, platform or public body may face similar technical issues, but their risks, purposes and obligations differ.

Clear, verifiable deliverables

We deliver more than a list of observations: each conclusion should support a useful decision.

SAMPLE ACTION MATRIX (ILLUSTRATIVE)

PRIORITY	FINDING	PROPOSED ACTION	HOW TO VERIFY
 MEDIUM	Unnecessary remote asset	Host locally or justify third party	New network capture
 HIGH	Form exposes excess data	Minimize fields and responses	Compare before/after responses
 HIGH	Poorly scoped access	Review permissions and server controls	Authorized functional test
 MEDIUM	Outdated policy	Match text to actual services	Cross-check documentation
 OK	Control implemented	Document and retain evidence	Verification test

Deliverables depend on the project:
executive assessment, data flows and vendor map, prioritized changes, prototypes or development, test plan, operational documentation and closeout record.

Flexible, responsible collaboration

From a focused assessment to a complete digital solution.

Assessment and roadmap

Understand the current state, identify opportunities and risks, and define a practical sequence of action.

Development or modernization

Design, build, integrate or improve specific components with staged delivery and testing.

Ongoing support

Support, evolution, periodic review and coordination with other vendors.

THE TEAM FITS THE SCOPE

AmparoLex can coordinate development and technical documentation. Qualified specialists are involved when forensic audits, specialist penetration testing or regulated legal work in another jurisdiction are required.
